

Tips on Categorizing Controllable Property

Controllable Property is tangible personal property with a cost under \$5,000. It includes items that are sensitive, portable, and theft-prone in nature. These items are prone to theft because they are either not secured, are easily portable, contain new technology, contain sensitive data, and/or they are adaptable for personal use.

All computers (desktops, laptops, Tablets, Notebooks) are considered controllable. Each department should use discretion to determine which other types of items should be categorized as controllable. This may differ from one department to another.

Other types of equipment that may be considered controllable include:

- Audiovisual equipment
- Televisions
- Projectors
- Communication equipment
- Cellular phones
- Printers
- External hard drives
- Scanners
- Cameras
- Scientific equipment

It is possible that an item that is considered controllable in one department may not be controllable in another department. Here are a couple of examples:

Example 1:

A projector that is on a cart and moved from one room to another with several potential users: Controllable.

A projector that is installed in a ceiling in a locked room: Not Controllable.

Example 2:

A microscope in an open lab with widespread access: Controllable.

A microscope in a locked lab with limited access: Not Controllable.

Again, each department should assess which items should be controllable in their area depending on their business environment and the risk that certain items may be stolen.
